

<b>Lesson</b>	<h1>Investigating Spectrum Users</h1>
5	
<b>Time Required</b>	<b>Lesson Summary</b>
100 minutes (2 – 50 minute class periods)	During this lesson, students will see the radio waves passing through their areas visualized on the screen in the classroom. Next, students will work in small groups to identify the broadcasters of these waves. Lastly, students will work independently to write a persuasive essay about how the spectrum should be shared among users.
<b>Standards Addressed</b>	
<p><b>NGSS</b></p> <ul style="list-style-type: none"> <li>○ HS-PH4-5 Waves and electromagnetic Radiation. Students who demonstrate understanding can communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.</li> <li>○ PS4.C Information Technologies and Instrumentation. <ul style="list-style-type: none"> <li>▪ Multiple technologies based on the understanding of waves and their interactions with matter are part of everyday experiences in the modern world and in scientific research. They are essential tools for producing, transmitting, and capturing signals and storing and interpreting information.</li> </ul> </li> </ul> <p><b>Virginia</b></p> <ul style="list-style-type: none"> <li>○ PH.5.b The students will investigate and understand that waves transmit energy and move in predictable patterns. Students will realize that wave interaction are part of everyday experiences and identify technological applications of the radio wave portion of the spectrum.</li> <li>○ English 10.6 The student will develop a variety of writing to persuade, interpret, analyze, and evaluate with an emphasis on exposition and analysis.</li> </ul> <p><b>West Virginia</b></p> <ul style="list-style-type: none"> <li>○ S.HS.P.23 Students will communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.</li> </ul>	

Vocabulary	Objectives
<p>If students completed lesson 4, there are no new vocabulary words.</p> <p>However, if students did not complete lesson 4, these are new words. Software-defined radio (SDR), interference, polarization, directionality, gain, coax choke.</p>	<ul style="list-style-type: none"> <li>• Students will identify which industries use the radio frequency section of the electromagnetic spectrum.</li> <li>• Students will be able to explain why the use of the spectrum changes during the day.</li> <li>• Students will develop an opinion on how users should share the spectrum. Then, they will write persuasive essays that convince the readers their solution is valid.</li> </ul>

## Pre-Requisites

Students need to know about the electromagnetic spectrum, electromagnetic waves, and how the RTL-SDR dongle works.

## Safety Considerations

None

## Pacing Notes

This lesson will take approximately 100 minutes. For a teacher with 50-minute class periods, this will take two days.

Day 1 – Scan the spectrum as a class, and students begin to work in small groups to identify known broadcasters.

Day 2 – As a class, identify the unknown broadcasters, students continue to work in small groups to identify known broadcasters, and students work alone on the position paper.

## Before the Lesson

Make sure you have set up the hardware and software as described in chapters 1 and 2 of the windows-based technical guide.

You will need to scan the spectrum in advance to provide this information to your students during activity #2 – Identification of registered users. Remember to scan the spectrum in 50 MHz bands (see activity #1 – scanning the spectrum for specific sections), then take a screenshot of the waterfall on your screen. It is best to do this scan after school hours. This will allow students to see the difference in spectrum usage due to the time of day.

### Assessments

### Classroom Instructions

#### *Pre-Activity Assessments*

#### *Introduction*

While taking attendance, students brainstorm all the devices they have that use the electromagnetic spectrum.

After you finish administrative duties, ask students to share things from their list

	and create a list on the board. To save time, ask students to only share things not already written on the board.
<p><i>Activity Embedded Assessments</i></p>	<p><i>Activities</i></p>
<p>As one student scans the spectrum, ask the rest of the class.</p> <p>How is the waterfall being produced?</p>	<p><b>Provide Background Information</b></p> <p>I. If you <b>did not</b> use Lesson one: Argumentation and radio waves in your classroom, spend several minutes explaining to students how the RTL-SDR dongle receives radio waves. Please discuss the following with your students: interference, polarization, directionality, gain, coax choke, the height of an antenna, and the location of an antenna. It would be best if you made sure students understand these things and their effect on reception.</p> <p>I. Scanning the spectrum Hand out copies of the spectrum scans you did previously. To cut down on paper and ink usage, place 2-3 screenshots per page and only distribute enough handouts for each pair or group of three students.</p> <p>Follow the instructions in the technical guide chapter 2 to scan the spectrum.</p> <p>Explain to students what you are doing and what they are seeing.</p> <p><b>Say:</b> This antenna receives radio frequency waves in the area. Those waves are invisible, but with the help of this dongle and some downloaded software, those signals are visualized into the image you see on the screen. This image is referred to as a "waterfall." The peaks occur at frequencies where there is a signal. The stuff between those peaks is referred to as "noise." This "noise" can be caused by many things, including bad reception from the antenna and less powerful signals from things such as microwaves. We will learn more about these less powerful signals during this lesson.</p> <p>In order to not overload the system, scan 50Mhz at a time, starting a 88 MHz and going up to 1600 MHz. Hint: Make the first scan a little larger, 88-140 MHz, to make the intervals easier to calculate. To increase student participation, have a different student come up and perform each scan using your computer.</p> <p>Each time a new section is scanned, have the students sketch the peaks that are not present on their papers (if necessary).</p> <p>Each time a section is scanned:</p>

Where is the dongle getting the data?

Can we do this without the dongle? Why or why not?

As students are working, walk around and ask groups.

What is your technique for identifying the broadcasters?

What was your reasoning for that technique?

How would you characterize the users as the frequency increases? Decreases?

Each time sometimes tries to identify a broadcaster.

**Ask:** Do you recognize any of these broadcasters? (Local radio stations use the frequency in the call sign so students may be able to identify some of the peaks.

After the class has scanned the required frequencies, point out that specific frequencies define this section of the spectrum. Therefore there is a limited amount of spectrum available for use. Point out that every peak detected was created by a single broadcaster. Therefore, there can only be a certain number of broadcasters before the broadcasts start overlapping and interfering with one another.

## 2. Identifying the known users of frequency in the area

Government agencies, public safety, and private businesses use radio frequencies to communicate with members of their organization and sometimes with the general public. These frequencies are a matter of public record and can be found on web pages.

Hand out the Spectrum Users page and assign students to work in groups of two or three to identify the broadcasters for each frequency.

## 3. Identifying additional broadcasters

After the majority of groups have identified all published broadcasters, stop all students in their work and turn their attention to the unpublished broadcasters.

Have the groups who are finished identify the frequencies without broadcasters. Allow groups to correct each other. It is possible that a group didn't identify a broadcaster despite that information being published.

It is possible that all peaks in the scans belong to published broadcasters or that the unidentified frequency only had a signal during the evening. If either of those is true, then skip this section.

If there are peaks without published broadcasters, rescan those frequencies. If possible, allow student volunteers to use your computer to

**Ask:** How did you come to that conclusion?

As students are working in small groups or writing alone, walk around.

If students are supposed to be working on the essay but have their heads down or are playing on their computers approach and ask why they aren't working on the assignment. Help those students overcome obstacles so they can succeed in the task.

**Ask:**

What are you working on right now?

Can you explain how you arrived at that answer?

do the scanning. Once the frequency has been scanned, have the student click the play button so students can hear what is being broadcast.

Have students share who they believe the broadcaster is until the class reaches a consensus for each frequency. Remember, I don't know is an acceptable answer. Many devices produce low-power radio waves that the SDR may detect. However, those devices do not make an audio signature that can be identified.

After the class has identified all the broadcasters possible

**Ask:** Where do you think is causing the rest of these peaks?

**Ask:** What is your reasoning for that answer?

**Say:** One of the questions on your page directs you to look up the "unlicensed" users of the spectrum. It is likely that some of these peaks can be associated with those sources.

4. Returning to the student page.

After the class has identified all non-published broadcasters possible have student groups return to the assignment page. They should finish the questions as a group. The students should also discuss the topic for the position paper together, although they should not write it together.

<p>Do you think there are alternative explanations?</p> <p>What do you need me to help you with right now?</p>	
<p><i>Post Activity Assessments</i></p>	<p><i>Closure</i></p>
	<p>Students will write a position paper on the local use of the radio frequency portion of the spectrum. This assignment will demonstrate that students understand that the spectrum is a limited resource that must be used for various purposes.</p>
<p><b>Culturally Inclusive/Responsive Components</b></p>	
<p>At the beginning of class on day two, have students write down their favorite radio stations in town and what they like about that type of music or talk. Then, give students a chance to share with the class. For example, if a student has lived elsewhere in the past, allow them to share radio stations they miss hearing. In those cases, ask students what they liked about that station and if there are ways for them to continue listening.</p>	

## Accommodations

If you do not have a way to project your screen on a screen or the wall, you can omit that portion of the lesson. Instead, screenshot the scans and share them with your class.

If you do not have access to student computers, you can print off the pages of local broadcasters. However, to reduce the amount of paper and ink, create a class set instead of printing off copies for each student.

For students with IEPs. Make any changes that are necessary to meet the student's needs. If the research is problematic for these students, have them work in a small group or with an instructional aid on this portion of the lesson.

For students who are ELLs. Make sure the students are in groups with native speakers. This grouping will allow them to understand what they need to do on the assignment.

## Educator Resources

## Optional Extension Activities

None
